

ABSTRACT

The present invention is a browser program for a content display apparatus, such as a TV set or a DVD player. This browser program displays the same number of windows provided correspondingly to at least a part of multiple buttons provided to a controller of the content display apparatus by superimposing them on a display area, is able to display at least a part of results of interpreting a markup language document in each window, and if one of the buttons other than the button corresponding to the window currently displayed in the highest-level layer is activated, it displays the window corresponding to this button in the highest-level layer.
